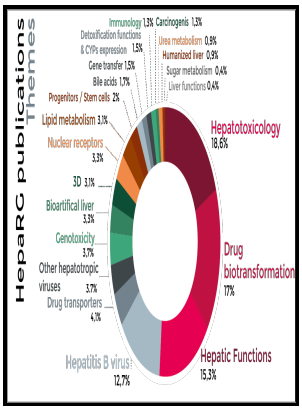
Rat liver perfusion - its development as a suitable model for the study of some hepatic drug interactions.

- - Liver Perfusion



Description: -
-Rat liver perfusion - its development as a suitable model for the study of some hepatic drug interactions.
-Rat liver perfusion - its development as a suitable model for the study of some hepatic drug interactions.
Notes: Thesis (Ph. D.)--The Queens University of Belfast, 1984.
This edition was published in 1984

An update on in vitro test methods in human hepatic drug biotransformation research: pros and cons

With the exception of heparins, GAGs exist in complex with core proteins as proteoglycans. At d 0, d 28, d 56, and d 84 in CCl 4-induced chronic hepatitis, there were similar portal pressure potency equations with various coefficients due to the concentrations of PE and Ach in the IPPRLs.

Drug delivery nanosystems targeted to hepatic ischemia and reperfusion injury

Uygun BE, Soto-Gutierrez A, Yagi H, Izamis ML, Guzzardi MA, Shulman C, et al.

Rat but not human interferons suppress hepatic oxidative drug metabolism in rats

Functional activity including production of albumin and urea, and consumption of glucose in liver constructs recellularized with twenty million rat liver cells. Interleukin-17 and its expanding biological functions. In: Sarmento B, Neves J, editors.

Rat but not human interferons suppress hepatic oxidative drug metabolism in rats

Immunostaining Samples from scaffolds recellularized with human or rat liver cells were fixed in formalin and embedded in paraffin. References are available at expertconsult. Hyperglycemia and liver ischemia reperfusion injury: a role for the advanced glycation endproduct and its receptor pathway.

A pharmacodynamic model of portal hypertension in isolated perfused rat liver

Serum ALT and HMGB-1 proteins reflected liver injury. Neutralization of CD95 ligand protects the liver against ischemia-reperfusion injury and prevents acute liver failure.

An assessment of the suitability of a modified technique of in situ rat

The density of collagen in blinded specimens was expressed as a percentage the ratio of collagen area per total analyzed field area. The average of the score taken from ten random fields was used to generate a single score for each IPPRL.

A pharmacodynamic model of portal hypertension in isolated perfused rat liver

This experimental HS model is a relatively mild degree of HS, which, if left untreated for up to 24 hours, results in a 27% mortality rate.
