Vectorborne disease control, 3013

When the incidence of infected animals or the disease itself increases alarmingly, it is very difficult to control its spread. There have been 43 locally acquired mosquito-borne cases reported in the continental United States, all of which occurred in Florida Figure 3. Thus, it is possible to detect quickly if the population of a given vector is increasing in an area and whether a virus is circulating.

Homestudy course 3013

Mosquito species within the Aedes genus primarily Ae. This course introduces the history of vector-borne disease control, application methodologies, public outreach and education, insecticide resistance and potential future technology.

Homestudy course 3013

At the moment, there are no vaccines marketed for people or birds. Homestudy course 3013

Outcome 4: Students will be able to discuss the insecticide and acaricide registration process.

Homestudy course 3013

The CDC Laboratory and several state health departments are performing ZIKV virus testing. Mécharles S, Herrmann C, Poullain P, et al.

eCite

The Zika Challenge Zika virus ZIKV is a mosquito-borne Flavivirus isolated from the Zika forest of Uganda in 1947.

Why is it difficult to control vector

It is not known if these findings are a direct result of the ZIKV infection or a consequence of microcephaly. This will suggest increasing control measures on farms and reducing the risk of infection of animals. ENTOM 6530 - Control of Disease Vectors Seminar Spring.
