5 Mind and Brain

Moderate stress can be introduced in many ways: by playing unfamiliar music before class, for example, or changing up the format of discussion, or introducing any learning activity that requires individual participation or movement.

Search

Here, blue highlights attention-related areas that had greater blood flow when people first learned a task.

Brain basics

The neuron integrates the information it receives from all of its synapses and this determines its output.

Search

For example, when schools practice tracking—dividing students into different reading groups or math groups based on ability—it can produce for students than keeping mixed-ability students together. The junctions through which information passes from one neuron to another are called synapses, which can be excitatory or inhibitory in nature.

Learning how the brain learns

Multi-dimensional approaches to teaching and learning work best because they engage many areas of the brain at once, and communication between different brain areas. The brain is programmed to pay special attention to any experience that is novel or unusual. This allows researchers and doctors to see create X-ray-like details of those organs.

How the Brain Creates New Neural Pathways

We then look at language in learning as an example of the mind-brain connection. Other brain cells also get into the act.
