We also will determine whether the deficit in lean deposition incurred with continuous feeding, compared to intermittent bolus feeding, during the neonatal period can be recuperated by leucine supplementation or intermittent bolus feeding. Studies will determine whether leucine supplementation will enhance lean growth by stimulating protein synthesis and reducing protein degradation in healthy neonatal piglets and during catabolic conditions such as sepsis.

Molecular and cellular aspects of iron

In iron-dosed gerbils on the vitamin E-enriched diet for 4 mo, in spite of a severe liver iron burden, a normal lobular architecture was found, with a dramatic decrease of collagen mRNA accumulation and collagen deposition.
