Seismic Design Principles

The natural period is a primary consideration for seismic design, although other aspects of the building design may also contribute to a lesser degree to the mitigation measures.

Basics of seismic interpretation

Retrofitting existing buildings is often easier with dampers than with base isolators, especially if the application is external or does not interfere with the occupants.

Basics of seismic interpretation

Effects of Earthquakes on Buildings Seismic Terminology For definitions of terms used in this resource page, see The aforementioned seismic measures are used to calculate forces that earthquakes impose on buildings. Variation in Perimeter Strength and Stiffness such as an open front on the ground level usually causes eccentricity or torsion. Damping: Buildings in general are poor resonators to dynamic shock and dissipate vibration by absorbing it.

Seismic Importance Factor

The component importance factor, I_p , shall be taken as 1. Loss arising from nonstructural damage can be a multiple of the structural losses.

Seismic Importance Factor

The soil also has a period varying between 0.
