Enhancing the Vitality of the National Institutes of Health: Organizational Change to Meet New Challenges

Washington, DC 20001 NOTICE: The project that is the subject of this report was approved by the Governing Board of the National Research Council, whose members are drawn from the councils of the National Academy of Sciences, the National Academy of Engineering, and the Institute of Medicine. Travelers should stop frequently to observe the surroundings and appreciate their accomplishments along the way. For more complex interventions, treatment programs tend to need greater preparation.

Science of Behavior Change

A couple of surprising findings emerged from this study. In a related vein, several hundred trials of stimulant treatments in pediatric psychopharmacology have been launched in this same time frame Jensen et al.

NIAAA Publications

Data file documentation, national hospital discharge survey, 1980-1995. Mild head injury in children and adolescents: a review of studies 1969-1995. The growing base of research on the genetic control of the developing brain structure and system, coupled with the ever-evolving, powerful technology that provides access to the developing brain, offers an unprecedented opportunity for understanding the etiology of mental disorders and, hence, ways to divert adverse developmental trajectories.

Science of Behavior Change

While the earlier trials generally used university-employed project staff, this has changed with the later trials, and actual providers in community agencies have been trained—and in some cases, retrained—to deliver MST. The Oregon General Assembly, for example, approved legislation in 2003 that requires the Oregon Mental Health and Addiction Services agency to purchase evidence-based practices. Nursing's social policy statement: second edition.

Federal funding of nursing research by the National Institutes of Health (NIH): 1993 to 2017

Understanding the mechanisms by which these empirically supported treatments lead to beneficial outcomes, as well as the factors that moderate treatment outcomes, will be critical to increasing their transportability.

National Institutes of Health

The lack of one-to-one correspondence between genotype and phenotype, and the etiological complexity of common mental disorders such as ADHD, anxiety disorders, mood disorders, and schizophrenia, present considerable challenges for researchers. These budgets have barely grown in the past decade despite considerable increases in the overall NIH budget. Taken together, these findings indicate that variations in maternal care can serve as the basis for a nongenomic behavioral transmission of individual differences in stress reactivity across generations.
