Sustainable forestry

The percentage shares of the chemical elements and ash represent the mean values obtained from the measurements on a dry basis db. Forest residues are generated during the harvesting of timber, as well as during forest tending treatments such as cleanings and thinnings Moskalik et al. This meant that there were no significant differences between the other three fractions and unfractionated biomass.

In turn, the International Energy Agency 2017 reports that biomass accounts for 10. Oxygen was the second most abundant element in the studied samples.

Course

The findings were compared to the results of previous research on other forms of forest biomass. They may also be comminuted and mixed with the topsoil using specialized mulching equipment. To optimize the utilization of such biomass, one must know its physical and chemical properties.
