## Evolution of microcomputer

Laboratory course for computer based two and three dimensional drawing and design based on ProEngineer. Credit is not awarded until the thesis has been accepted. I then give some examples of medical instruments in which the microprocessor has played a key role and in some cases has even empowered us to develop new instruments that were not possible before.

Relationship between physical and chemical structure of materials and biological system response are discussed as well as choosing, fabricating, and modifying materials for specific biomedical applications.

Not more than 12 credits in may be taken in a regular semester, nor more than six credits in a summer session. The principles and instrumentation of radiation dosimetry with focus on the applications in radiation therapy will be introduced in this course.

This device should be useful for applications such as antiarrhythmic drug studies, for pacemaker and postsurgery evaluations, and for detecting premonitory as well as life-threatening arrhythmias. The first part of the course will focus on cell source, with an emphasis on human stem cell acquisition and differentiation. The course includes hands-on demonstrations of key techniques and problem-based group projects.

### **Design, implementation and evaluation of microcomputer**

Medical laser systems, optical properties of tissue, light propagation in tissue, laser-tissue interactions, and surgical applications of lasers are also covered. Optical diagnostics using scattered light: laser Doppler flowmetry, and dynamic light scattering and opto-chemical and evanescent wave sensors are also covered. Typically Offered: Offered by
