The Effects of Carbenoxolone on Human Myocardial Conduction: A Tool to Investigate the Role of Gap Junctional Uncoupling in Human Arrhythmogenesis

If a stimulus or PVC in the ventricle or PAC in the atrium falls in this period, it may induce either atrial fibrillation if in the atrial RRP, or ventricular tachycardia or ventricular fibrillation if in the ventricular RRP. J Clin Anesth 1991; 3: 149—52. PMID: 28404615 Free PMC article.

Electrophysiological characterization of murine myocardial ischemia and infarction

A small sandbag or other type of weight may be placed on top of the bandage for extra pressure on the site, especially if the groin was used. Read the form carefully and ask questions if anything is not clear.

Cardiac electrophysiology and conduction pathway ablation

Autoradiographic localization of alpha-adrenoreceptors, muscarinic acetylcholine receptors and opiate receptors in the heart.

Electrophysiological characterization of murine myocardial ischemia and infarction

Slow conduction in the infarcted human heart. In the present study, we found that decellularization optimizes the function of the adult optic nerve in supporting the oriented outgrowth of dorsal root ganglion DRG neurites. Medicine may be given or a shock may be delivered to stop the arrhythmia.
