rGreen Landfill

How are location decisions prepared and, respectively, what does the corresponding decision-making process look like? To better understand how a new DST could be developed, possibly integrating new analytics, presented below is a review of some of the DST elements that have been used for conventional ISWM planning.

Using MCDA and GIS for hazardous waste landfill siting considering land scarcity for waste disposal (Journal Article)

We discuss these biases across three key aspects of stakeholder engagement; stakeholder selection, stakeholder response and stakeholder attrition.

Decision support framework for the regional facility location and development planning problem

Here, managers are recommended two possible ways. Using this suitability index 15 different sites were visited and based on the numerical evaluation provided by MCDA most suitable sites were determined.

Suitability assessment using multicriteria spatial decision support system for the existing landfill sites of Chittagong City, Bangladesh

In this section, managerial implications that derive from the research on the RFLDP are outlined. Reed MS, Graves A, Dandy N, Posthumus H, Hubacek K, Morris J, Prell C, Quinn CH, Stringer LC. Especially, by economic development organizations on different layers.

SMART: An Integrated Planning and Decision Support Tool for Solid Waste Management

The influence of locational dynamics on location decisions is crucial as will be depicted in the following. In the Envision rating system there are five main categories: 1. Concurrently, revenue from void space is also affected by excavation and sorting technology F5, 5%, which determines the amount of waste that will be re-landfilled—this is high in case of low separation efficiency, thus lowering the volume of the recovered void space.

A framework for stakeholder engagement during systematic reviews and maps in environmental management

To accomplish this, lean thinking changes the focus of management from optimizing separate technologies, assets, and vertical departments to optimizing the flow of products and services through entire value streams that flow horizontally across technologies, assets, and departments to customers. Using 21 exclusionary criteria, as input layers, masked maps were prepared.
