Subtle changes in chemical structure can affect drug toxicity

As animal models to predict chemical-induced autoimmunity are virtually lacking, emphasis should be given to the development of such models. Naloxone is added to buprenorphine to reduce abuse potential. Resistance to these neuraminidase inhibitors still seems to be minimal.

Structure—toxicity relationship and structure—activity relationship study of 2-phenylaminophenylacetic acid derived compounds, Food and Chemical Toxicology 2014. Detailed knowledge of toxic mechanisms will enhance the predictability of newer risk models currently being developed and will result in continuous improvement. .

PCP is particularly problematic among HIV patients with compromised immune systems. The auto-phosphorylation typically results in a prolonged response to the agonist e.
