Frontiers

Furthermore, conducted a review on the gendered impact of Covid-19 and found that 68.

Joint Commission Online

Research has highlighted the impact on psychological well-being of the most exposed groups, including children, college students, and health workers, who are more likely to develop post-traumatic stress disorder, anxiety, depression, and other symptoms of distress. These results suggest that effective prevention and intervention efforts designed to reduce cyberbullying may include early detection of delinquent behaviors offline, including substance use and aggressive behavior.

Health status

Adolescents who are targeted via cyberbullying report increased depressive affect, anxiety, loneliness, suicidal behavior, and somatic symptoms.

Health status

For example, Finkelhor et al found that 32% of targets of cyberbullying experienced at least one symptom of stress. Only a few studies have documented higher prevalence rates for cyberbullying among males.

Frontiers

Similarly, other studies have documented a significant relationship between increased cyberbullying victimization and increased substance use. Psychological and Social Suffering and the Empathic Process In analyzing the psychological impact of the quarantine, the importance for individuals to feel integral part of the society emerged, an aspect often undervalued in psychological well-being.

Frontiers

Their results revealed that targets of cyberbullying generally cope with cybervictimization by telling someone, avoiding friends or peers, getting revenge, and withdrawing from events, thus potentially undermining important social connections.

Health status

Finally, past studies have shown that the frequency of online communication increases the risk of cyberbullying victimization and perpetration. However, although it is not possible to predict the duration of the pandemic, we know very well the serious impact of these measures on the society, on relationships and interactions, in particular on the empathic process. Cyberbullying perpetration and problem behaviors Generally speaking, studies that have examined the impact of cyberbullying perpetration on adolescent health have shown that those adolescent perpetrators of cyberbullying were more likely to engage in problem behaviors including higher levels of proactive and reactive aggression, property damage, illegal acts, substance use, delinquency,, and suicidal behavior.
