PROTEAN® i12™ IEF System

What makes it special is its ability to detect affinity interactions be it in free or immobilized form

Types of Electrophoresis

It has been determined that the actual electrophoretic mobility of the protein, U , is a function of the mobility of the protein in a concentrated sucrose solution U_0 and T , the total concentration of the acrylamide in the polymerized gel. Gel matrix First, a matrix made by polymerizing and cross-linking acrylamide units is employed.

How Does 2D Gel Electrophoresis Work?

At this point it has no net charge and so migration ceases as there is no electrical attraction toward either electrode.

Techniques: Electrophoresis

Figure: DNA fragments separated on an agarose gel Variations on gel electrophoresis: Isoelectric focusing: In this technique, a pH gradient is set up within the polyacrylamide gel. Cellulose acetate electrophoresis This technique is a modification in the Paper electrophoresis technique developed by Kohn in 1958. References Rabilloud T, Lelong C.

Iso electric focussing gel electrophoresis

In addition, you should be able to determine the subunit composition of the proteins. All these anions will move at the same speed once equilibrium is established between them and during that time the separation is done on the basis of their mobility.
