

Studies on the role of atomisation in aqueous tablet film coating

Leicester Polytechnic in collaboration with Colorcon Ltd - Application of Aquesou Suspensions and Latex Dispersions of Water

Description: -

-Studies on the role of atomisation in aqueous tablet film coating

-Studies on the role of atomisation in aqueous tablet film coating

Notes: Thesis (Ph.D) - Leicester Polytechnic, Leicester 1990.

This edition was published in 1990

Excipients used in the Formulation of Tablets

Decrease in spray application rate and use of optimum and efficient drying conditions can solve this problem. Small droplets were shown to produce a more complete and concise film coating, and are expected to benefit from enhanced stability as a result of lower porosity and be less at risk to detrimental over-wetting. This gives, assuming an oxygen radius of 1.

Application of Aquesou Suspensions and Latex Dispersions of Water

For identifying a best formulation for delayed release pellets of pantoprazole sodium.

Evaluation of Moisture Sorption by Tablet Cores Containing Superdisintegrants During the Aqueous Film Coating Process

Specific interactions of water with biopolymers. The microspheres have been characterized in terms of their morphology, encapsulation efficiency, and ability of stabilizing pantoprazole in acidic media. Pantoprazole determinations were carried out using a validated spectrophotometric method for analysis of drug dissolution media. A thorough analysis of M—O bond distances in solid alkali metal compounds with ligands binding through oxygen has been made from available structure databases.

Tablet Coating Process: Concepts and Advancements

These structures are hereafter referred to as approved structures, and are given in Tables S1a—S1e in the together with considered but nonapproved structures of the various classes.

Techniques of Tablet Coating: Concepts and Advancements: A Comprehensive Review

Mod Chem appl 4: 181. Simulation studies have reported Li—O bond distances of 1. Surface Partitioning in Organic—Inorganic Mixtures Contributes to the Size-Dependence of the Phase-State of Atmospheric Nanoparticles.
