## Disturbance, Invasion, Restoration, and Rangeland Health

Our studies have shown that moderate cattle grazing can be used to maintain a desirable montane riparian community. Will this second chance at love be doomed before it has a chance to rekindle? Mountain meadow management and surface water quality.

Research was initiated at the San Juan Research Center in 1988 to investigate the ecological relationships between the oakbrush *Quercus gambelii* and ponderosa pine *Pinus ponderosa* vegetation types with respect to grazing, logging, and fire treatments. Given this more-than-probable cause and effect relationship, the most sensible and prudent path is to design and apply mitigation measures to alleviate this heating that can negatively affect both the natural environment and human society. If sedimentation pretreatment was to be used before infiltration, then much of the pollutants will likely be removed before infiltration.
