**EconPapers: Ingrid Woolard**

The standard Pearson correlation coefficient  $\rho$  and the Gini correlation index have the same numerator:  $\text{cov } y k$ ,  $F y$ .

**Income inequality in South Africa report**

For the pseudo-Gini index  $C yk$ , the weights attached to each individual correspond to the ranking in the distribution of total income  $F y$ , whereas for the Gini index  $G yk$ , the reference ranking would be that of the distribution of the  $k$ th income component  $F yk$ . This result is mostly driven by emerging market economies, and is attributable to the larger difference between the pseudo-Gini index of capital and labor income relative to advanced economies.
