## Vaccine

However, its widespread use has been associated with some adverse events, including vaccine-associated paralytic poliomyelitis and the emergence of vaccine-derived polioviruses VDPVs. Adjunct to appropriate changes in vaccination strategy, developing new antiviral drugs would be warranted for termination of chronic infections and outbreak control.

## William Woodville

Patient 22 was a boy who had received 4 doses of bOPV serotypes 1 and 3 and IPV. The rate of asymptomatic iVDPV infection in our national study 2.

**An early alternative to vaccination (inoculation of cowpox) and the potential role of horsepox virus in the origin of the smallpox vaccine**

Classification of certain smallpox adverse vaccine reactions can be confounded by lack of information or the absence of pathognomonic findings.

**Reports on a series of inoculations for the Variolæ Vaccinæ, or Cow**

Serial screening of PID patients for poliovirus infection is an essential step in the transition to a polio-free world. This rapid evolution in the VP1 region to reach iVDPV definition could be explained by crossover of genetic material between the preexisting iVDPV2 and concurrently evolving SL3.

**Reports of a Series of Inoculations for the Variolæ Vaccinæ, Or Cow**

Genomic sequencing of a horsepox virus isolated in Mongolia in 1976 indicated that, while closely related to vaccinia, this horsepox virus contained additional, potentially ancestral sequences absent in vaccinia.
