Aurora Australis Observed from the International Space Station

It did not and the values shown here are from the same 3-hour intervals of the UT day.

Geomagnetic Storms

The largest storms that result from these conditions are associated with solar coronal mass ejections CMEs where a billion tons or so of plasma from the sun, with its embedded magnetic field, arrives at Earth. September, October, March and April are some of the best months to view the aurora borealis.

Geomagnetic Storms

The sites with magnetic latitude higher than 35° are shown in blue.

Magnetic storms and the aurorae, Eos Transactions

Particles escape from the star from the on the surface, hurtling particles of plasma, known as solar wind, into space.

Geomagnetic Storms

Instead, auroral emission on Venus is faint and more diffuse as the entire atmosphere is exposed to broadly the same intensity of particles from the solar wind—similar to if you evenly spread a coat of paint on a canvas. The relevant parts of his logbook on August 28 and September 1 are shown here C1, v. They usually have little motion, are quite dim, and might even be confused with clouds.
