Music and Movement for Young Children's Healthy Development

Music and movement activities are appropriate for children of preschool age. This article offers practical curriculum ideas and useful Web sites for teachers and families.

Satomi Iizumi-Taylor, Ursula Gunn Morris, Carol D. Morrison, and Linda Hedges

Upon entering the preschool classroom at home or day care, most children begin moving up and down in place and around the room. They may run, skip, hop, gallop, or walk. They may also crawl or dance in the room, including the furniture. Young children enjoy moving around when they have opportunities to do so. In fact, movement is an important part of their everyday lives. Movement is also an important part of their healthy development. Physical activity is associated with many health benefits for children. It is one cause of obesity in young children (Dove, 2009; Evans-Pritchard & Morris, 2009).

Physical activities are vital to stay healthy.

This article describes how teachers can facilitate music and movement activities that support young children's healthy development by encouraging them to move in various ways. It also provides ideas for music and movement, which teachers can help their students learn.

Importance of Physical Activity

In safely orchestrated settings, children have an much more mobility than those of their parents and grandparents. This is important because physical activity has been shown to contribute to the development in children's physical activity levels. For example, children who are physically active are less likely to become obese. Physical activity also includes consumption of fatty foods and large portions of food. These factors are associated with an increased risk of developing heart disease and diabetes (American Heart Association & Berchie, 2009), increases in blood pressure (American Heart Association & Berchie, 2009), increases in blood glucose (American Heart Association & Berchie, 2009), increases in body mass index (American Heart Association & Berchie, 2009), and increases in waist circumference (American Heart Association & Berchie, 2009).
