phenotype in Huntington disease.

## The Role of Microenvironment in Axonal Regeneration

The major site of involvement is the cervical spinal cord with the myelitis-like inflammatory lesions continuing more than two segments, and extending to the brainstem. A wound was made in the limb skin of an axolotl outlined by arrows. Age and Environment Influences on Mouse Prion Disease Progression: Behavioral Changes and Morphometry and Stereology of Hippocampal Astrocytes.

The relative importance of each characteristic varies from one ecological region to another. .

### **Frontiers**

The evidence to support the use of clinical tests for superior labral anterior to posterior complex SLAP is weak or absent. Based on the severity of urodynamics findings in our series, patients with TM and LUTS should have thorough baseline urological evaluations including urodynamics and be offered ongoing surveillance. At the index operation four patients underwent a concomitant acromioplasty, while four patients underwent supplementary anterior labrum fixation using suture anchors.
