ABSTRACT

AIM:-The study aimed to find the immediate effect of singing on autonomic function and pulmonary functions in school aged classical singers.

OBJECTIVE:-

- To compare the autonomic pulmonary function in children singers before and after the singing session.
- To compare the diastolic and systolic pulmonary function in children singers with non singers of the age group.

Methodology:-A total of 20 children of 10-12 years of age were included in the study. Autonomic parameters were assessed and pulmonary function tests were compared between and inside the singing group and non singing group. The study was conducted in a controlled environment without external noise or disturbance.

Results:-The systolic and diastolic pulmonary function in PEFV (exhalation volume in 1 second) of 10-12 years old children in singing group were significantly higher than non singing group. Both systolic and diastolic pulmonary function in PEFV and PEFR were significantly higher in singing group immediately after singing than in non singing group when compared to non singing group.

Keywords: Pulmonary Function, Autonomic Function, Classical Singing

INTRODUCTION

In唱歌 is an essential physical function in daily life. It is a complex process involving the coordination and co-ordination of all those involved in the production of sound. Singing is a learned skill. The requirements for developing musicality are different from those required for the respiratory mechanism. Recent researches have shown that singing can have a significant role in helping to improve respiratory muscle strength.

Respiratory regulation is believed to be influenced by the autonomic nervous system. Respiratory performance, including forced variations,

parasympathetic tone, and respiratory exchange such as diastole ventilation. While regulation is in the control of the autonomic nervous system, the rate, depth and rhythm of breathing are controlled by the central nervous system. The autonomic nervous system consists of two processes on two neural pathways which control the heart, blood vessels, glands and smooth muscle tissue in a coordinated way. As such, they help in maintaining homeostasis. These pathways are responsible for involuntary regulation of the vocal performance.

The autonomic nervous system has two main divisions. Within this same time, many of the autonomic functions can also be evaluated. These processes control during the
