Equipment Guide

The instruction that calls the macro program in the program is called the user macro instruction, and the function that the system can use the user macro program is called the user macro function. When executing, you only need to write the user macro command to execute its user macro function. The form of the program name is determined by the CNC system.

Investing in Machine Control and Guidance Technology : CEG

Nowadays, numerical control technology is also called computer numerical control technology. It is an effective way to solve the problems of variable parts, small batches, complex shapes, and high precision requirements, and to achieve high-efficiency and automated processing. The threshold limit is the annual emission rate above which a company may need additional controls or review.

Investing in Machine Control and Guidance Technology : CEG

The rounding error is the error produced by rounding the coordinate value to an integer pulse equivalent value during data processing. This kind of CNC milling machine has been used for processing aircraft parts in the mid-1950s.

Hitachi Rolls Out Grade Control Technology Options : CEG

Therefore, the CNC machine tools selected by the aircraft and rocket manufacturing departments and the engine manufacturing departments are different.

Best Available Control Technology BACT and Air Permitting

Because airplanes, rockets, and engine parts have different characteristics: airplanes and rockets have zero parts, large component sizes, and complex shapes; engine zero, small component sizes, and high precision. Continuous track control is also called contour control, which requires the tool to move in accordance with the specified track relative to the part. The type and realization method of the shortest feed path are as follows.

New Company Focuses on Machine Control Like a Laser : CEG

The instructions of the numerical control system are compiled by the programmer according to the material of the workpiece, the processing requirements, the characteristics of the machine tool, and the instruction format numerical control language or symbols prescribed by the system. A subroutine is a section of processing program that can be called by appropriate machine control instructions, and it generally has an independent meaning in processing.
