Periodontal (Gum) Disease

Journal of the American Dental Association.

Periodontal disease

This stage of gum disease shows evidence of periodontal pockets. Simple oral hygiene will no longer cut it.

Periodontal diseases

The different stages of periodontal disease. Periodontal disease affects 50% of all Americans age 30 and older. A very strong risk factor is one's genetic susceptibility. In Israeli population, individuals of Yemenite, North-African, South Asian, or Mediterranean origin have higher prevalence of periodontal disease than individuals from European descent.

Periodontal Diseases

Periodontal disease is generally due to bacteria in the mouth infecting the tissue around the teeth. The dentist or hygienist must perform a re-evaluation four to six weeks after the initial scaling and root planing, to determine if the person's oral hygiene has improved and inflammation has regressed. This process in turn activates which begin to destroy bone, and it activates that destroy ligaments.

Periodontal Diseases

It is believed genetics could explain why some people with good plaque control have advanced periodontitis, whilst some others with poor oral hygiene are free from the disease.
