Discoveries in these areas can have a dramatic impact on the lives of the tens of millions of people with deafness and other communication disorders. To my horror the telephone was answered by an unmistakable South Boston voice of jagged steel, renowned for rasping the Rosary over the radio. State-of-the-art molecular, genetic, and genomic techniques are being used to identify genes that may predispose an individual to chronic otitis media.

Case studies from a public psychiatric hospital and a community mental health agency illustrate each of the seven areas and present evidence of the model's efficacy. Janet Rifkin observes that theoretical advances need to be translated into realistic designs for practical application, and points to the difficulties involved in such translation. In 1989, less than five percent of newborns received hearing screening prior to leaving the hospital, and most children were not identified to have a hearing impairment until two to three years of age.
