Classic drugs associated with acute interstitial nephritis include antimicrobial agents in particular B-lactams and sulfonamides , NSAIDs, proton pump inhibitors, and aminosalicylates 46. Pretreatment of experimental animals with furosemide or sodium protects against decreases in renal plasma flow and glomerular filtration rate immediately following amphotericin B treatment. Not uncommonly, the substances listed on the package label are present in varying amounts ranging from large, to small, to even nonexistent.
