The Ecological Relationship of Gray Wolves and White

Ecological studies of the timber wolf in northeastern Minnesota. Old Shore Road Trail 6 km easy linear This trail follows the Lake Huron shoreline and offers excellent views of the shore and beach areas. The average annual number of wolves submitted for bounty decreased to 186-189 during 1953-1965, and a gross estimate of the population was 350-700 wolves, restricted primarily to the northeastern portion of the state MNDNR files, Cahalane 1964.

Shedding Light on the Problem of Deer Overgrazing in Carolinian Forests

In a study of wolves and deer in north-central Minnesota Bearville study area north of Grand Rapids , Fuller 1990 documented an annual wolf-caused mortality rate of 0.

Dinosaur Provincial Park

Here, in the old-growth management area, beside the planned clear-cut, Connolly and her colleagues have marked out a circular area one hectare in size, one of 28 such areas they are studying in different locations in the rainforest. This type of predator-prey relationship—a predator population contributing to the decline of its prey population, followed by a lag period and subsequent decline in the predator population—is classical, but it is not simple.

The Ecological Relationship of Gray Wolves and White

Historically, wolves occupied all habitats of Minnesota, ranging from prairies to forests Young and Goldman 1944, Mech and Frenzel 1971.

Managing Tree

Martin and Martin 2001, Martin 2006 560 Hamilton area Wilkie counted the rings of a cut stump about two metres in diameter. In the Queens County study area, predation on deer has decreased in recent years as coyotes have switched to the slowly increasing hare population. Gray wolf density and its association with weights and hematology of pups from 1970 to 1988.
