Aside from cosmetic and manufacturing issues, there may be tradeoffs in mechanical flexibility versus resistance to abrasion and high temperature. Source: Pixabay DIN EN ISO 8044 defines corrosion as the reaction of a metallic material with its environment, which causes a measurable change in the material and can impair the function of a metal component or an entire system. Organic corrosion inhibitors are classified as mixed inhibitors, meaning they affect both anodic and cathodic portions of the corrosion cell.

As a result, methods to reduce the activity of the exposed surface, such as and , can increase a material's corrosion resistance. Repair involved removing deteriorated concrete, and milling to within 13 mm of embedded reinforcement.
