Integral Low Fin Tubes have a very large Heat Transfer ratio thus it is possible to reduce the volume, weight of the Heat Exchangers and finally reduce the cost. Airside fouling factors are sometimes specified but have little effect on the already low airside heat transfer coefficient.

Fin Tubes can improve the thermal performance of a Heat Exchanger without changing in Shell size, Flow Arrangement and Repositioning of tubing.

Experimental investigation on downward flow boiling heat transfer characteristics of propane in shell side of LNG spiral wound heat exchanger

Some fixed tubesheet plain tube designs result in very large mean metal temperature differences between the tubes and the heat exchanger shell. . Only trial basis may be adopted.
