The result is three basic types of interactions: small wave vertical group velocity larger than the phase speed of the inertia wave, closely matches, or is much slower than the phase speed of the inertia wave.

Prior studies have shown increased platelet aggregation downstream of stenosis, or analogous geometrical models that induce flow separation and recirculation via abrupt expansion. It offers Markov-chain Monte Carlo MCMC posterior-distribution sampling for several algorithms, Levenberg-Marquardt least-squares optimization, and uniform non-informative, Jeffreys non-informative, or Gaussian-informative priors.
