Electromyography In Clinical Practice: A Case Study Approach (3rd Edition)

If the distal and proximal responses have dissimilar waveforms, the discrepancy in amplitude between the two may represent in part a phase cancellation rather than true conduction block. The referring physician is not well versed with disorders of the peripheral nervous system.

Electromyography in Clinical Practice: A Case Study Approach / Edition 2 by Bashar Katirji MD

In demyelinating lesions, the distal CMAP remains unchanged with persistent conduction block across the lesion. Fasciculation potentials recorded, in raster mode, from the vastus lateralis in a patient with motor neuron disease.

Electromyography in Clinical Practice: A Case Study Approach, 3rd Edition

An accurate conduction velocity may be obtained by using collision studies that abolish action potentials of the crossed fibers. Clinically, myokymic discharges often give rise to sustained muscle contractions, which have an undulating appearance beneath the skin bag of worms. This is usually measured from baseline to negative peak and expressed in millivolts mV.

Electromyography in Clinical Practice: A Case Study Approach

Whenever possible, the nerve is stimulated at two or more points along its course. This section serves as an orientation and a quick guide to the readers who are not familiar with the techniques, terminology and basic concepts. Fibrillation potentials typically develop within 2—3 weeks 56 Introduction to Clinical Electromyography A B C Figure 4—10.

ELECTROMYOGRAPHY IN CLINICAL PRACTICE A CASE STUDY APPROACH 2E

Supramaximal stimulation of a peripheral nerve during a motor nerve conduction study median nerve stimulating at the wrist while recording abductor pollicis brevis. Possible factors to account for the length-related slowing include abrupt distal axonal tapering, progressive reduction in

axonal diameter, or shorter internodal distances.

Electromyography In Clinical Practice: A Case Study Approach (3rd Edition)

Electrodiagnosis in diseases of nerve and muscle: principles and practice, 3rd ed. The tabulated NCS form should be detailed but not overcrowded with unnecessary data. Referring physicians should also describe the EDX study to their adult patients, particularly in regard to the discomfort associated with it, without creating unnecessary heightened anxiety.

This is an anomalous connection between the median and the ulnar nerves in the forearm that usually consists of motor axons.
