Antitarget

III Antitargets: Cytochrome P450s and Transporters. To demonstrate the practical use of this concept, we consider the case of 5-HT2B HTR2B agonism associated with the development of cardiac valvular disease: If a clinical candidate with high potency at the therapeutic target shows weak agonist activity at this off-target then a long-term rodent experiment including both echocardiography and histopathology should be considered within the preclinical assessment for the support of a final decision for further development of the compound. Predicting Side Effects

Other kinds of interactions include interactions with terfenadine, cyclosporin A and metoprolol. The most characteristic arrhythmia in LQTS patients is torsades de pointes TdP , a distinctive polymorphic ventricular tachycardia characterized by QRS waves that oscillate in amplitude about the isoelectric line on the ECG.

Predicting Side Effects

Differentiating drug-induced multichannel block on the electrocardiogram: randomized study of dofetilide, quinidine, ranolazine, and verapamil. Side Effects: Freedom of Information and the Communication of Doubt.

Label Propagation Prediction of Drug

The close amalgamation of in vitro system biology with in silico tools provides a remarkable system capable of identifying associations of pathways with drug biological read-outs. Thus, the duration of the QT interval may be affected by both the velocity of repolarization and ventricular conduction velocity.
